

AI changes the economics.

The useful question is how much effort it takes to deliver something valuable, and whether we can improve that without losing quality.

ILLUSTRATIVE EXAMPLE — NOT A CLIENT RESULT

Let's look at how this could work

01 — 06

First, write down the current effort.

For this example, we assume 20 customer reports each month and 3 hours to prepare each one. That gives us 60 hours to compare against.

ILLUSTRATIVE EXAMPLE — NOT A CLIENT RESULT

20 reports × 3 hours

60 hours / month

Then set a target we can test.

Suppose a pilot gets each report down to 1 hour, including human review. That would take the monthly total from 60 hours to 20.

ILLUSTRATIVE EXAMPLE — NOT A CLIENT RESULT

60 hours

Assumed current effort

20 hours

Proposed pilot target

Show how the work would change.

We connect approved data and automate preparation and drafting, and your team reviews each report before it goes to the customer.

ILLUSTRATIVE EXAMPLE — NOT A CLIENT RESULT

Approved data → preparation and drafting

Human review → customer delivery

Released time still needs a use.

The target would release 40 hours a month, but that is not automatically a cash saving. We still need to check quality, adoption, build cost and running costs.

ILLUSTRATIVE EXAMPLE — NOT A CLIENT RESULT

60 hours – 20 hours

40 hours potentially released

Choose one repeatable job to measure.

Record how long it takes today and what a good result looks like, and we can work out whether a pilot is worth doing.
